21 Supervised learning is a method of machine learning algorithm that provide dependence input as well as correct the independence output for predictin the result in a dataset. it aim is to find the mapping function to map the dependence variable (x) with independence variable (y).

28 Data preprocessing is the process to make raw data to become a data set. that can understand by machine.

31 K in k-means algorithm is the number of predefind cluster that need to be use in the process.

25 Application of data science
- Transportation
- Financial
- Health
- Banking.

24 Challenge of machine learning.
- Most of the data are raw so it is difficult and take time for machine to learn
- it is very complex to study the large amount of data and hard to select algorithm.

26 - Structured data is the data that is predefined in dataset that can be understand by machine.
- Semi-stuctured data is the combination of structured data and unstructured data which is need to do the data preprocessing proces to be able for machine to understand it.

27 we can find out the outlier in the data by compare all the data. and the outlier is the abnormal data compare to the other data in the dataset.

34 P.1 : Good classification. all the data are separate

P.2 : Bad classification : the are some data left.

P.3 : Bad classification : Because the space between the boundary line is small.

30 The continuous attributes are discretized by changing to interval form.
